Bodies Of Knowledge In Project Management And Project Quality Management

Abstract: One of the main trends is standardisation of project management. Some of the most important bodies of knowledge in project management, which were created by professional associations for project management are given in this paper. The main of the project management, apart from minisation of time, resources and costs, is to finish the project in the required quality, i.e. it is very important during the whole process of project management to provide realizing the project without any deviations from the previously set quality standards. Basic processes of project quality management are: quality planning, quality assurance and quality control.

Keywords: Project management, Bodies of Knowledge, Quality, Project Quality Management

1. INTRODUCTION

Modern organizations nowadays do their business under very complex and changeable conditions, which require a constant adjustment to very turbulent environment, in order to exist and carry on with efficient work. Without project management organisations cannot adjust themselves to all changes and function efficiently. Project management, as a special management discipline, is developing more and more and is in accord with fast management development as a general science about managing the business and other systems and undertakings. From using basic concept based on software packages, we have reached forming and using new areas such as project quality management, project risk management, human resources management, project communications management, project changes management...

Project management of a high quality is necessary in every activity and on all levels – individual, in business organisations, on the state level. in the world, project management is a separated profession, described as "application of knowledge, skills, tools and techniques to project activities to meet project requirements" [8]. Having in mind its basic aim – achieving as much as possible with the fewest possible resources, it is possible to feel the lack of educated staff in this area. Standards, which have appeared in the area of project management recently, helps project managers a lot in their work. One of the main trends is standardisation of the process of the project management. As main active participants in the standardisation of the project management some professional associations as well as other associations have appeared. Most professional associations have created their body of knowledge, a document that is necessary for
2. BODIES OF KNOWLEDGE IN PROJECT MANAGEMENT

A number of project management associations have formed chapters around the world to encourage the development of project management as a profession. More than fifty years a considerable body of knowledge has built up around the world project management tools, skills and techniques. The purpose of the body of knowledge is to identify and describe the best practices that are applicable to most projects most of the time [1]. There is a common approval about their value and usefulness. In the continuation some bodies of knowledge in project management are briefly discussed.

PMI's PMBOK Guide

PMI (Project Management Institute), based in the USA, has created the oldest and the most often used body of knowledge of project management. It has been complemented during the time. The ascendant of PMBOK was PMI’s ESA (Ethics, Standards and Accreditation) report from 1983. which nominated six basic components: the management of scope, cost, time, quality, human resources and communications.

PMBOK from 1987. was a completely new document and the first published body of knowledge of project management. It added contract/procurement management and risk management to the previous six primary components.[3]

PMBOK Guide from 1996. was a completely processed document to which project integration management was added to the previous eight components. Nine components were later renamed as Project Management Knowledge Areas with special chapters for each one. Each area of knowledge has numerous component processes from which each was examined in advance under conditions of inputs, tools and techniques and outputs. There are thirty-nine component processes altogether. A Guide to the Project Management Body of Knowledge from 1996. was revised twice in 2000. and 2004. but with no changes in its structure from 1996.

PMBOK Guide. Third Edition, from 2004. contains forty-four component processes (Figure1.) [3]
Different versions of PMBOK Guide focus on management skills that are applied to most projects most of the time, and it does not include in the knowledge areas those general management skills, which can be required just in some projects or in some occasions.

**The Association of Project Management Body of Knowledge (APMBoK)**

APM from UK launched its body of knowledge in 1988, which was quite different from PMI’s. It incorporates not only inward focused project management topics (such as planning and control techniques), but also broader topics in which the project is being managed (such as social and ecological environment), as well as specific areas (such as technology, economics, finance, organisation, procurement and people, as well as general management) [1].

One of the key differences between the PMI and APM approaches is that, in its own words, the PMBOK Guide’s Knowledge areas include only knowledge and practices that “are applicable to most projects most of the time”, with contextual issues and are discussed separately in its Framework section. [3] The APMBoK includes knowledge and practices that may apply to some projects and/or part of the time which is much more inclusive approach.

The fourth edition of APMBoK from 2000 consists seven main titles, with forty-two items that are shown in the figure 2. In this body of knowledge a short examination of all titles and topics as well as recommendation for each topic are given.
### 2. STRATEGIC

- Project success criteria
  - Strategy/project mgt. plan
- Value management
- Risk management
- Quality management
- Health, safety, environment

### 5. COMMERCIAL

- Business case
  - Marketing and sales
- Financial management
- Procurement
- Legal awareness

### 7. PEOPLE

- Communications
  - Teamwork
- Leadership
- Conflict management
- Negotiation
- Personnel management

### 3. CONTROL

- Work content and scopemgt.
  - Time scheduling/phasing
- Resource management
- Budgeting and cost mgt.
- Change control
- Earned value management
- Information management

#### Figure 2. The Association of Project Management Body of Knowledge [3]

The IPMA's BOK - The International Project Management Association (IPMA)

The International Project Management Association (IPMA), a federation of national project management associations, mainly European was spawned by the APM and registered as an international organization in Switzerland in 1998.

The IPMA developed an IPMA Competence Baseline (ICB) in 1999. which primary purpose is to provide basic recommendations for its members of the associations for development their own National Competence Baselines. Most members have developed their own baselines, which provide a base for the certification of their project managers. The other purpose of ICB was a harmonisation of previously existed European bodies of knowledge.

ICB contains forty-two elements e.g. twenty-eight basic and fourteen additional
elements of knowledge and experiences of project management. Each member of National Competence Baselines must have twenty-eight basic elements.

**Japan’s P2M**

Japan’s Engineering Advancement Association (ENAA) founded a committee for the introduction, development and research on project management in 1999, which created A Guidebook of Project and Program Management for Enterprise Innovation – officially abbreviated P2M in 2001. Development of P2M and certification system appeared as the result of Japan’s enterprises needs to develop more innovative approaches for the development of their business. This is a very long and detailed document that contains 420 pages and it does not include only one project management but contains areas of program management.

P2M has the following chapters in project management:
- Project Strategy Management
- Project Finance Management
- Project Systems Management
- Project Organization Management
- Project Objectives Management
- Project Resources Management
- Risk Management
- Project Information Technology Management
- Project Relations Management
- Project Value Management
- Project Communications Management

**3. PROJECT QUALITY MANAGEMENT**

Applying the concept of project management it is possible to provide all needed support and create conditions to achieve already planned results, as well as to organize and monitor the process project realisation. Having in mind that the project is being realised to fulfill required needs of all stakeholders, the focus is on the project quality.

Project quality management is one of the most important functions of the global concept of project management. Project quality management can be more precisely defined as a part of the process of project management, which provides project realisation without any deviations from already set standards.

It means that a lot of attention must be paid to project quality management in each phase of project management in order to make sure that the client will get as a final product what he has really required. Nowadays the purchaser is the one who defines his requirements about quality standards through the requirements for high performances of the products, faster development, high quality of the project results and timely realisation of the project.

**The AIPM’s Australian National Competency Standards for Project Management (ANCSPM)**

The Australian Institute for Project Management (AIPM) developed and documented their standards in 1977 as the Australian National Competency Standards for Project Management (ANCSPM).

The format of ANCSPM emphasises performance-oriented recognition of competence in the workplace, and includes the following main components [3]:
- Units of competency: the significant major functions of the profession.
- Elements of competency: the building blocks of each unit of competency.
- Performance criteria: the type of performance in the workplace that would constitute adequate evidence of personal competence.
- Range indicators: describe more precisely the circumstances in which the performance criteria would be applied.

Elements of competency are shown in the following words: determine, conduct, guide, implement and others. There are three main elements of competency for each unit.

The ANCSPM incorporated the nine knowledge areas of the PMI’s PMBOK directly into the knowledge part of their qualification program.

**South African unit standards**

South Africa developed its own performance-based competency standards. Standards have been completed for a National Certificate in Project Management.
technological standards, lower prices as well as the fewer number of defective products.

Project management as one of the functional areas of project management includes the following processes:

- Quality Planning
- Quality Assurance
- Quality Control

3.1 Quality Planning

Quality planning includes identification which quality standards are relevant for project and how to meet them. Implementation of those standards in the project is a key part of quality planning. Figure 3 shows inputs, tools and techniques and outputs of project planning process.

Techniques of quality planning from figure 3 are the ones that are most frequently used in projects.

Quality project management in the domain of project, should start from determining project requirements, regulations and standards that must be applied. A project engineer which runs the whole project or just a part of it must provide that all set project requirements and conditions must be fulfilled as well as during doing the project regulations and standards must be strictly followed in order to meet required quality of the project.

One of the input details for quality planning is quality policy. Quality policy is a document made by experts for quality and approved by top management. It defines which quality aims should be achieved, quality level that is acceptable for the organisation as well as individual responsibilities for conducting and assuring quality.

3.2 Quality Assurance

Quality assurance includes management processes that provide performance standards.

Quality assurance is focused on reducing the possibility of appearing possible mistakes and errors and creating all necessary conditions in the organization in order to achieve planned and required products and services quality. It is the way of doing business that enables improving the production efficiency and business on the whole.

Quality assurance includes periodical examination of project performance in order to assure that the project meets suitable quality standards during its realisation. Process of quality assurance means taking responsibility for quality during and after the end of the project. Quality assurance is a managerial function, and project manager may have the strongest effect on project quality in this phase through processes and procedures that assure that activity realisation meets client’s requirements.

Inputs, tools and techniques, as well as outputs that are most frequently used in quality assurance are shown in picture 4.
3.3 Quality Control

Quality control includes the process of determining primary project requirements and examining coordination of the project realisation with required standards and defining the way of eliminating the causes of non-fulfillment of quality standards.

Quality control activities include continually monitoring processes, identifying and eliminating problem causes, use of statistical process control to reduce the variability and increase the efficiency of processes [8].

Project management team should have a working knowledge of statistical quality control, especially sampling and probability, to help quality control outputs. [9] In figure 5 inputs, tools and techniques, as well as outputs of quality control phase are shown.

4. CONCLUSION

Adjustment to modern business conditions needs fundamentally different work organization and business operations of organizations. Projects and project management are becoming a more important component in modern business conditions. Project management is a modern multidiscipline concept that became a legal base in well-developed countries, standardized. Around the world numerous bodies of knowledge in project management have been developed which are standards of knowledge in accord with geographical domains.

Concept of project management is nowadays enriched with new areas of project management knowledge. A separate area of project management is project quality management, which means a line of processes and activities to support the project to meet the requirements and needs because of which it has started.

Project quality management may be of crucial importance for organisation existence in a very competitive environment.
